Robust Control of an Inverted Pendulum on a Cart Alexis Ball ME/ECE 854 Robust Control Final Project Due: April 29, 2007 Abstract This paper investigates the design and analysis of three controllers used to stabilize an inverted pendulum on a cart. This is accomplished by decomposing each control algorithm into two separate phases: swing-up

Robust Control of an Inverted Pendulum on a Cart

A robust balancing controller for flexible inverted-pendulum systems is proposed. Design guidelines to enhance the robustness to disturbances are outlined. A flexible pendulum-on-cart and its rigid-link counterpart are compared.

In our case, balance the upside down pendulum. There are two main types of control loops: open loop control and closed loop control. When implementing an open loop control, the control action or the command from the controller is independent of the system's output.

In the case of an inverted pendulum, the designed H = controller fulfills the predefined robust stability requirement, however, it does not fulfill the pre-defined performance requirement. In the μ-synthesis, the enhancement of the controller can be achieved taking the structured singular values into consideration.

Robust control design of wheeled inverted pendulum assistant robot Abstract: This paper examines the design concept and mobile control strategy of the human assistant robot i-PENTAR (inverted pendulum type assistant robot). The motion equation is derived considering the non-holonomic constraint of the two-wheeled mobile robot.

According to control purposes of inverted pendulum, the control of inverted pendulum can be divided into three aspects. The first aspect that is widely researched is the swing-up control of inverted pendulum [1, 2]. The second aspect is the stabilization of the inverted pendulum [3-4].

just like the broom-stick, an Inverted Pendulum is an unstable system. Force must be properly applied to keep the system stable. To achieve this, proper control theory is required. The Inverted Pendulum is useful in evaluating and comparing of various nonlinear systems. It is virtually impossible to balance a pendulum in the inverted

Design of a Robust Controller for Inverted Pendulum

The control strategies such as LQR and robust control is used to overcome the Inverted Pendulum problem. Robust control scheme used in this paper is a Linear Quadratic Regulator Tracking Controller with a FeedForward controller. Performance of the pendulum’s angle and
cart's position is assessed and presented.

INTRODUCTION

The rotary inverted pendulum system is widely used as a typical problem to study various modern control approaches. However, it is difficult to achieve precise control for such systems.

The inverted pendulum is a system that has a cart which is programmed to balance a pendulum as shown by a basic block diagram in Figure 1. This system is adherently instable since even the slightest disturbance would cause the pendulum to start falling. Thus some sort of control is necessary to maintain a balanced pendulum.

2. Robust Control of the Double Inverted Pendulum. To further verify the robustness, for the inverted pendulum system in the basic Simulink simulation block diagram, as shown in Figure 4, the −80 dBW white Gaussian noise is applied, and the required signal is generated by the white noise function in the simulation.

We need to keep the pendulum upright while moving the cart to a new position or when the pendulum is nudged forward (impulse disturbance ). Control Structure. The upright position is an unstable equilibrium for the inverted pendulum. The unstable nature of the plant makes the control task more challenging.

The robust generalized dynamic inversion control is designed in two stages; in the first stage, constraint differential equations of the controlled state variables are prescribed, which encompasses the control objectives. To enforce the constraint dynamics, the equivalent control is realized by means of Moore-Penrose generalized inversion.
